

■ LightEye Wind Lidar

Compact coherent Doppler wind sensing for affordable deployment at scale

Wind lidar. Everywhere.

LightEye is a 1550 nm coherent Doppler wind lidar platform designed to reduce the cost and friction of remote wind measurement while enabling denser deployments.

CURRENT PLATFORM

Designed for field measurement and validation

- Coherent Doppler wind measurement at 1550 nm
- Compact system architecture intended for scalable deployment
- Digital wind-profile output for engineering, forecasting and research workflows
- Full scanning capability under active development
- Ongoing side-by-side validation against established wind lidar systems

VALIDATION

Measured against reference instrumentation

Preliminary co-located measurements show strong agreement with established wind lidar across the common measurement range. Detailed bias, RMSE, R^2 , sample count, heights and averaging-period results are published as validation campaigns mature.

* Detection range depends on atmospheric backscatter and measurement conditions. Specifications are subject to validation and product evolution.
